Hi Reinhold,

Thanks for reaching out.

1. Feature parity: Is the above workflow fully achievable with Better PDF Automation for Jira Cloud, including QR code generation, PNG header/footer insertion, and automation-triggered PDF creation?

Please note that the core export features are provided by *Better PDF Exporter*.
Better PDF Automation is only a thin layer for the automation framework to call the exporter app.

Unfortunately, QR code generation is not supported as a built-in functionality (but see workaround at the bottom).

If you think this would be a useful feature for your team, please follow these steps:

1. Please vote (click "thumbs-up") for the feature request here:
<https://midori.zendesk.com/hc/en-us/articles/360010185639-Support-for-QR-codes>
2. Also, add a comment to the feature request article, explaining your specific needs and use case.
3. Finally, remember to click "Follow" in the top-right to get automatic updates.

This is VERY IMPORTANT to get your vote, as we regularly go through the most requested features and implement them in the future.

As an alternative solution, you could utilize some external QR code generator service, and call that in the app:

-
- <https://www.midori-global.com/products/better-pdf-exporter-for-jira/data-center/documentation/scripting>
 - <https://www.midori-global.com/products/better-pdf-exporter-for-jira/data-center/documentation/recipes#external-rest-apis>

2. *Template migration path: What is the recommended and technically safest approach to migrate existing Velocity-based PDF templates and Groovy logic from DC to Cloud? Are there known limitations or blockers (e.g., lack of Velocity/Groovy support, required rewrites, missing APIs)?*

Please find all important information for the migration in the following page:

<https://www.midori-global.com/products/better-pdf-exporter-for-jira/cloud/cloud-migration-guide/>

If you have specific questions, just ask.

3. *Cloud-specific constraints: Are there any architectural or functional showstoppers in the Cloud version that would prevent replicating our current DC invoice-generation process?*

The concept you described should work in the Cloud too.

However, please note that the app is using a quota system (for paid licenses, max. 200 exports or 60 minutes of execution time in a 60 minutes time window) and the time of a single export is limited to 10 minutes.

<https://www.midori-global.com/products/better-pdf-exporter-for-jira/cloud/troubleshooting#quota>

Regards,

--

We are migrating from a Jira Data Center environment to Jira Cloud and are currently using Better PDF Automation for Jira (DC) to generate and send invoices via an Automation Rule. Our existing DC setup includes the following elements:

- PDF invoice generation triggered by Automation
- Adding a PNG based SEPA payment QR code to the PDF at a specific, template controlled position

-
- Custom PDF template built with Velocity
 - Additional logic implemented in a Groovy script

Before proceeding with the migration, we need clarification on the following points:

1. Feature parity: Is the above workflow fully achievable with Better PDF Automation for Jira Cloud, including QR code generation, PNG header/footer insertion, and automation-triggered PDF creation?
2. Template migration path: What is the recommended and technically safest approach to migrate existing Velocity-based PDF templates and Groovy logic from DC to Cloud? Are there known limitations or blockers (e.g., lack of Velocity/Groovy support, required rewrites, missing APIs)?
3. Cloud-specific constraints: Are there any architectural or functional showstoppers in the Cloud version that would prevent replicating our current DC invoice-generation process?

We would appreciate guidance on the migration strategy and any documentation or examples that address DC→Cloud template conversion.
